Properties of patiromer

Patiromer

- Organic potassium binder¹
- Orally administered¹
- Non-absorbed¹
- Calcium-exchange polymer that binds potassium and increases potassium excretion¹

Light microscopy image²

Patiromer in patients using RAASi

AMETHYST-DN

1-year, Phase II, open-label, randomized, dose-ranging efficacy and safety study in patients with CKD including a RAASi run-in period for patients who needed RAASi to control their blood pressure

Bakris GL *et al.* *JAMA* 2015;314:151–61

OPAL-HK

Two-part, 12-week, Phase III, single-blind randomized withdrawal study in patients with HK and CKD, using at least one RAASi at a stable dose

Weir M *et al.* *N Engl J Med* 2015;372:211–21

PEARL-HF

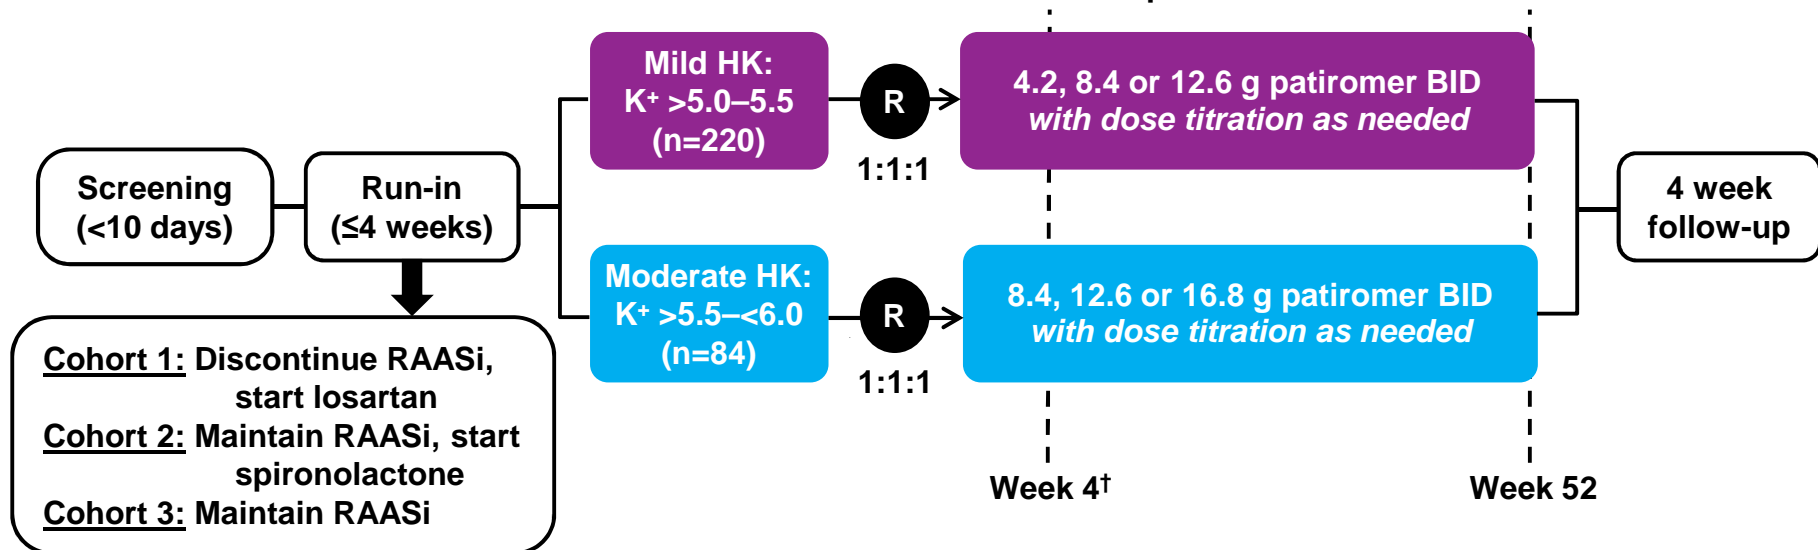

28-day, Phase II, randomized, double-blind, placebo-controlled, parallel-group study in HF patients at high risk for HK and initiating spironolactone

Pitt B *et al.* *Eur Heart J* 2011;32:820–8

AMETHYST-DN: Phase II, 52-week, open-label study

Inclusion criteria: CKD*, T2DM, hypertension, stable RAASi dose ≥ 4 weeks AND

- Cohorts 1 and 2: ACR ≥ 30 mg/g with K^+ 4.3–5.0 mEq/L
- Cohort 3: K^+ >5.0 – <6.0 mEq/L

*eGFR 15–60 mL/min/m²; [†]Primary endpoint

ACR, albumin creatinine ratio; BID, twice weekly; HTN, hypertension

Bakris GL *et al.* JAMA 2015;314:151–61

AMETHYST-DN: Baseline demographic characteristics

	Mild HK (n=220)	Moderate HK (n=84)
Male, %	63	63
Mean age, yrs (SD)	66.5 (8.8)	65.8 (8.2)
White, %	100	100
Mean eGFR, mL/min/1.73 m ² (SD)	42 (15)	36 (16)
CKD stage, n (%)		
3a	68 (31)	17 (20)
3b	84 (38)	27 (32)
4	39 (1)	27 (32)
5	2 (1)	4 (5)
Mean urine ACR, mg/g (SD)	1124 (1901)	1217 (1666)
HF, n (%)	77 (35)	28 (33)
Mean serum K ⁺ , mEq/L (SD)	5.2 (0.25)	5.7 (0.36)
Mean sitting BP, mmHg (SD)		
Systolic	155.1 (11.2)	156.5 (13.8)
Diastolic	84.4 (10.9)	82.9 (12.5)

BP, blood pressure; SD, standard deviation; yrs, years

Bakris GL *et al.* JAMA 2015;314:151-61

AMETHYST-DN: Change in serum potassium levels

Number of patients	Treatment														Follow-up	
	BL	1	4	8	12	16	20	24	28	32	36	40	44	48	52	56
Mild HK	218	204	199	192	175	168	161	161	163	158	156	151	148	149	145	126
Moderate HK	83	83	73	70	65	62	62	62	61	53	53	53	52	49	49	47

All serum potassium analyses are based on central lab values; 3 patients (2 with mild HK and 1 with moderate HK) did not have a central lab serum K⁺ value at baseline and therefore are not included in the analysis at this timepoint; at all timepoints, $P < 0.001$ (2-sided t-test) for least squares mean changes from baseline and week 52 (or from last dose of patiromer received during the study. BL, baseline

AMETHYST-DN: Change in systolic blood pressure

- Clinically relevant reductions in systolic blood pressure were observed in all starting dose groups in both strata

*Cohort 1: Discontinue RAASi, start losartan, cohort 2: Maintain RAASi, start spironolactone; †Cohort 3: Maintain RAASi. S, screening

Epstein M *et al.* Presented at ERA-EDTA 2016: Abstract SO010

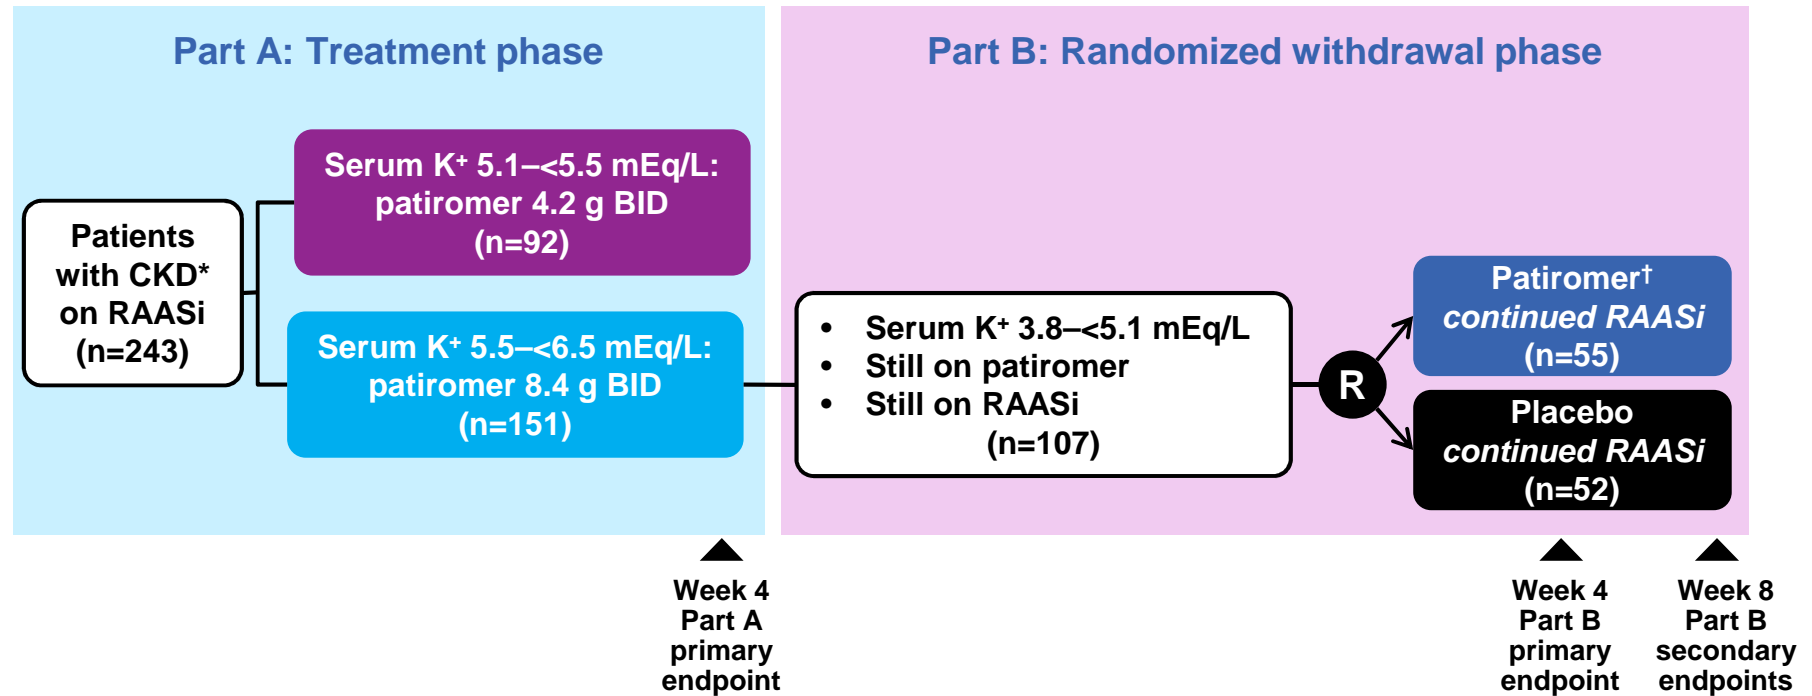

AMETHYST-DN: Most common AEs over 52 weeks*

AEs, n (%)	Mild HK (n=220)	Moderate HK (n=84)	Overall (n=304)
Hypomagnesaemia[†]	15 (7)	11 (13)	26 (9)
Worsening of hypertension	14 (6)	10 (12)	24 (8)
Worsening of CKD	14 (6)	14 (17)	28 (9)
Diarrhoea	12 (6)	5 (6)	17 (6)
Constipation	11 (5)	8 (10)	19 (6)
Hypoglycaemia[†]	4 (2)	6 (7)	10 (3)

*Occurring in ≥5.0% of patients in either baseline HK group; [†]Based on PI assessment; may not have correlated with lab values <LLN. LLN, lower limit of normal

Bakris GL *et al.* JAMA 2015;314:151–61

OPAL-HK: Phase III, 2-part, single-blind withdrawal study

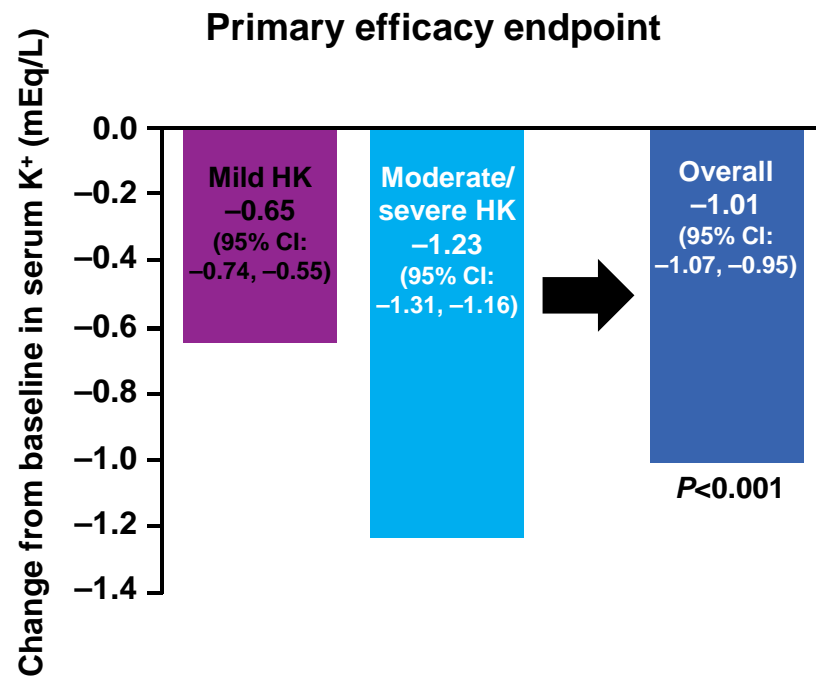

*eGFR 15 to <60 mL/min/m²;

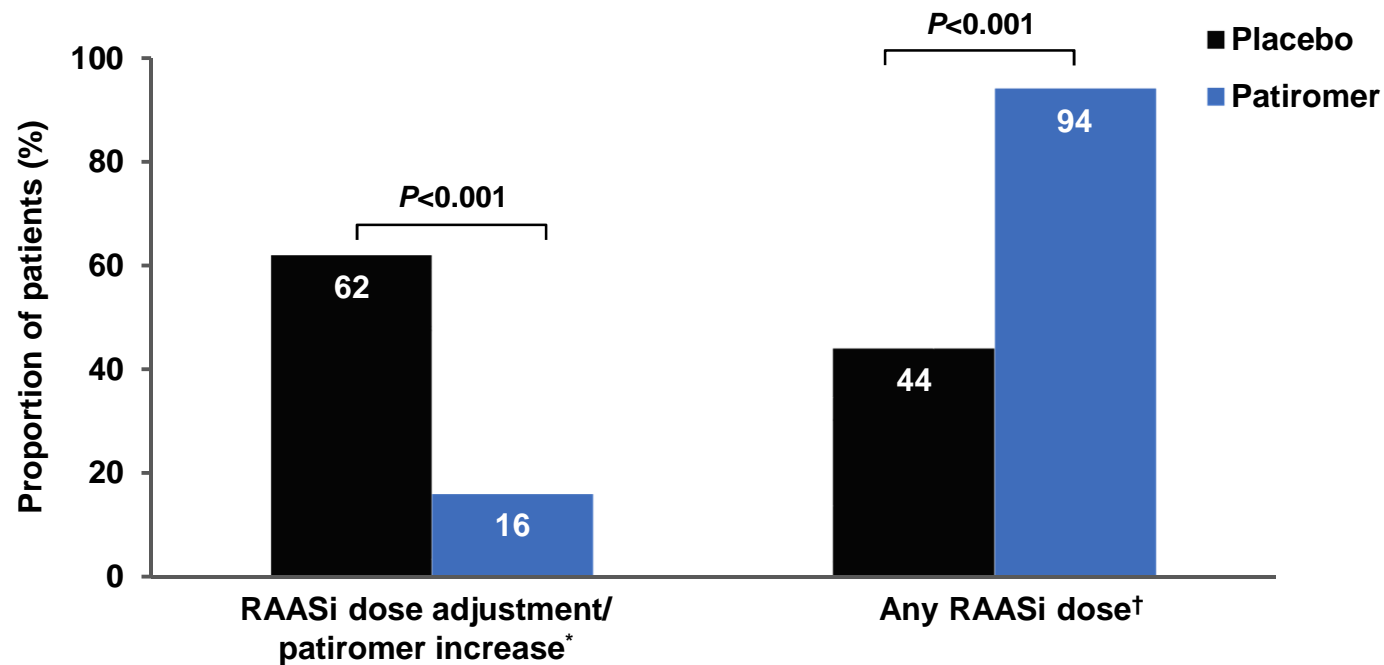

†Dose adjusted as needed by treating physician

1. Weir MR *et al.* *N Engl J Med* 2015;372:211–21; 2. Pitt B *et al.* Presented at: 18th Annual Scientific Meeting of the Heart Failure Society of America; Las Vegas, NV; Sept 14–17, 2014

OPAL-HK (Part A): Primary and secondary efficacy endpoints

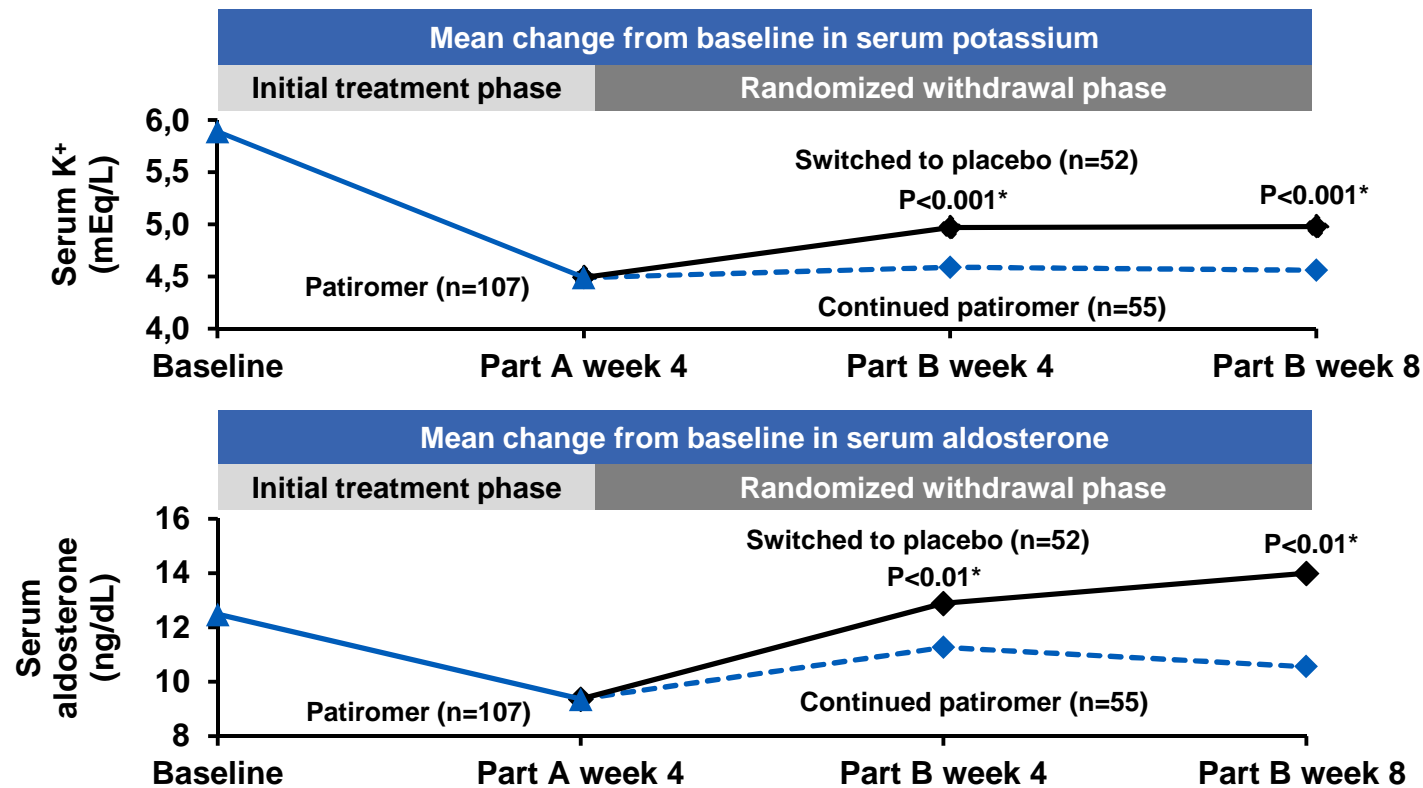

OPAL-HK (Part B): Exploratory endpoints – statistically significant results

*Requiring any adjustment of RAASi (ie down-titration or discontinuation) or patiromer dose increase due to hyperkalaemia at any time during Part B; †Receiving any dose of a RAASi at the end of Part B

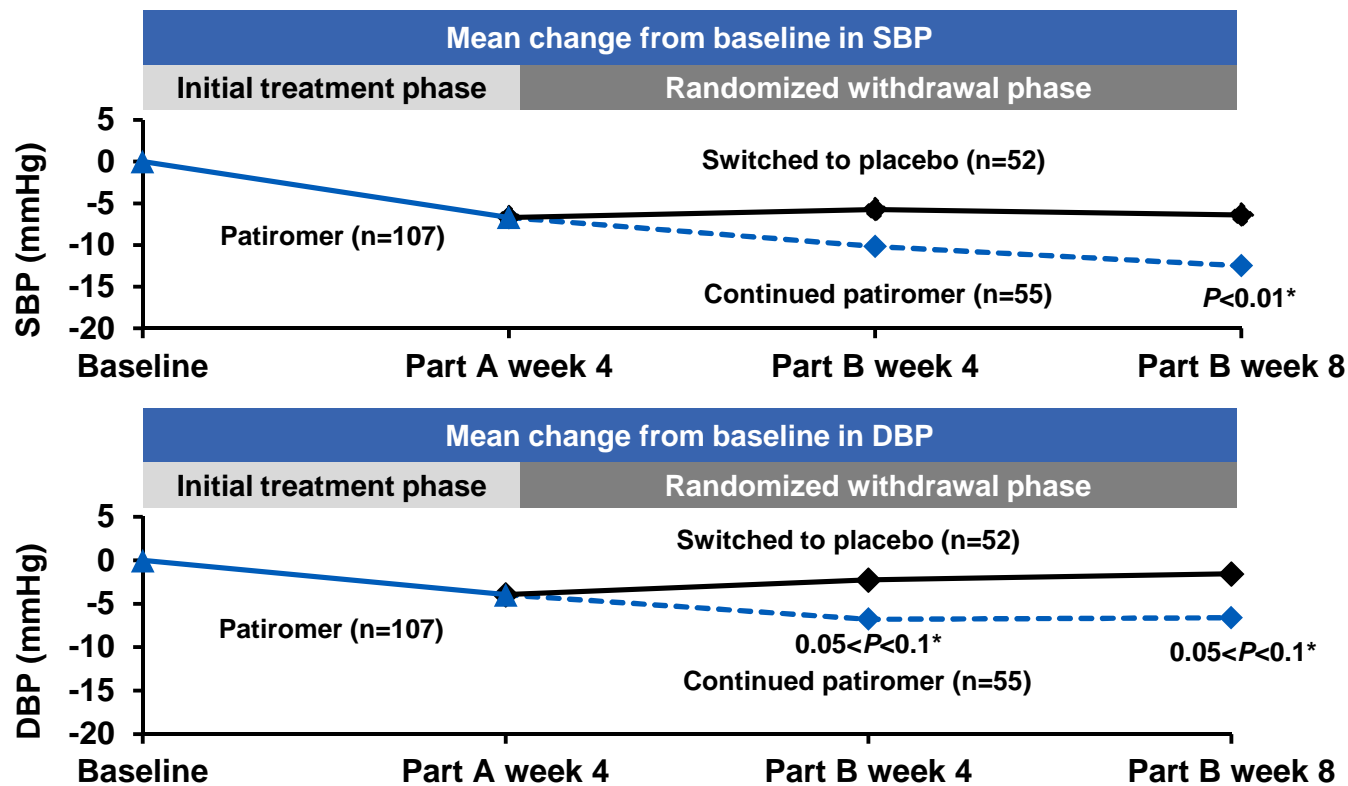

Weir MR *et al.* *N Engl J Med* 2015;372:211–21

OPAL-HK (Part B): Serum potassium and aldosterone

*versus Part A Week 4

OPAL-HK (Part B): Blood pressure

*versus Part A Week 4

Weir MR *et al.* Presented at: Am Soc of Hypertension. 2015; LB-P-01

OPAL-HK: Most common adverse events

Part A: Initial treatment phase*

AEs, n (%)	Patiromer (n=243)
Any	114 (47)
Constipation	26 (11)
Diarrhoea	8 (3)
Hypomagnesaemia	8 (3)
Nausea	8 (3)
Anaemia	7 (3)
Chronic renal failure	7 (3)
Serious AEs[†]	3 (1)

Events are listed if they occurred in at least 3% of patients

Part B: Randomized withdrawal phase*

AEs, n (%)	Placebo (n=52)	Patiromer (n=55)
Any	26 (50)	26 (47)
Headache	4 (8)	2 (4)
Supraventricular extrasystoles	1 (2)	2 (4)
Constipation	0	2 (4)
Diarrhoea	0	2 (4)
Nausea	0	2 (4)
Serious AEs[†]	1 (2)	0

Events are listed if they occurred in at least 4% of patients in the patiromer group

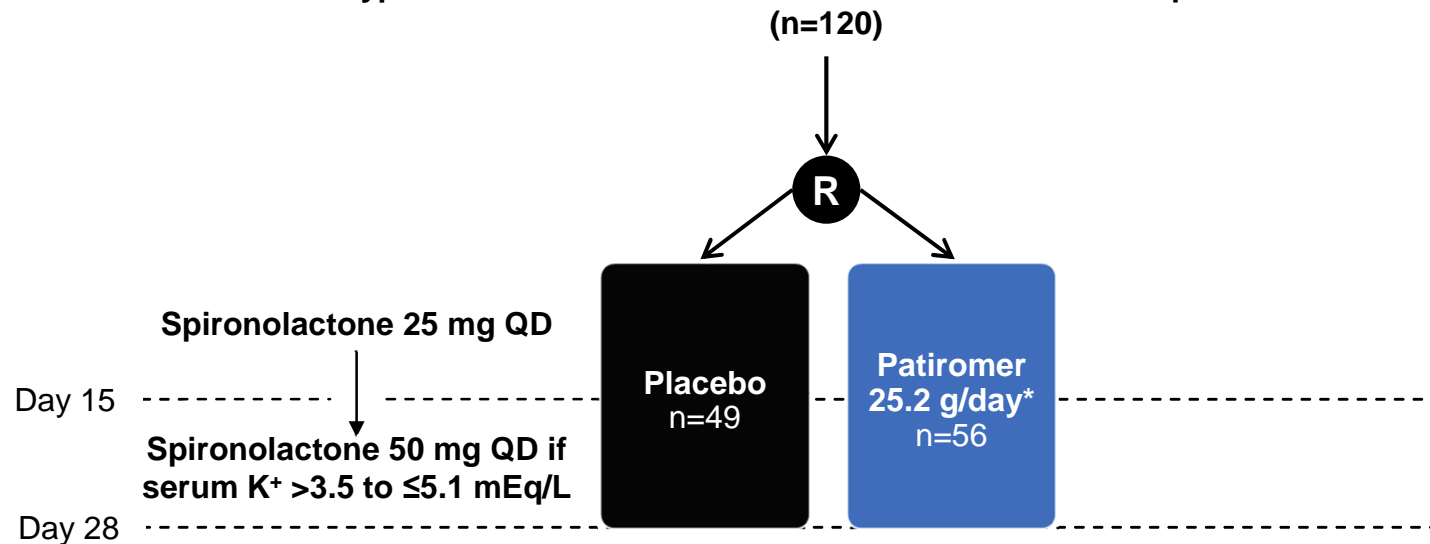

During the initial treatment phase and through its follow-up period, the incidence of hypokalaemia (serum potassium level <3.5 mmol/L) was 3.0%; *Including safety follow-up period for that phase, which was 1–2 weeks after discontinuation of the study drug; †All SAEs are included; none were considered related to the study drug. SAE, serious adverse events

Weir MR *et al.* *N Engl J Med* 2015;372:211–21

PEARL-HF: Phase II, double-blind study in HF patients at high risk for HK and initiating spironolactone

Chronic HF, aged ≥ 18 years, clinically indicated to receive spironolactone and serum $K^+ > 4.3$ – 5.1 mEq/L, and either of:

- CKD (eGFR < 60 mL/min) and on ≥ 1 RAASi (ACEi, ARB) or β -blocker
- Documented hyperkalaemia that led to discontinuation of RAASi or β -blocker within 6 months

- *No patiromer dose titration

PEARL-HF: Primary endpoint

*versus placebo
LS, least squares

PEARL-HF: Up-titration of spironolactone

Patients able to titrate up spironolactone dose to 50 mg daily

	Placebo (n=49)	Patiromer (n=55)	<i>P</i>-value
Total, n (%)	36 (74)	50 (91)	0.019

Drug Drug interaction study

- Single dose design
- Patiromer given at the highest approved dose (25.2 grams)
- Statistical analysis included construction of point estimates and 90% confidence intervals for the ratios of the geometric means for the $AUC_{0-\infty}$ and C_{max} . The bioequivalence criteria for the log-transformed parameters were 80 – 125%.

Treatment A (Baseline PK of Single-Dose Test Drug)

Test Drug
(Single Dose)

Treatment B (Simultaneous Co-administration)

Test Drug
(Single Dose)

Patiromer
(25.2g)

Treatment C (3-hour Separation)

Patiromer

Geometric Mean Ratios ($AUC_{0-\infty}$, C_{max}): Co-administered

When concomitantly taking metformin with Veltassa[®], the main effect is a reduction in the bioavailability of metformin. The reduction is of the same magnitude as when metformin is taken with food.

^a As levothyroxine is recommended to be administered ½ hour to 1 hour before breakfast and patiromer is recommended to be administered with food, the two drugs were not administered at the same time and co-administration represents a 40 minute separation between levothyroxine and patiromer. Values adjusted for baseline thyroxine concentration; AUC_{0-48} , area under the plasma concentration time curve from time 0 to 48-hour sampling; CI, confidence interval; C_{max} , maximum observed plasma concentration; LCL, lower confidence interval limit; N, number of subjects planned for enrollment for each drug evaluated; UCL, upper confidence interval limit.

Abbreviations: $AUC_{0-\infty}$, area under the plasma concentration time curve from time 0 extrapolated to infinity; AUC_{0-48} , area under the plasma concentration time curve from time 0 to 48-hour sampling; CI, confidence interval; C_{max} , maximum observed plasma concentration; LCL, lower confidence interval limit; N, number of subjects planned for enrollment for each drug evaluated; UCL, upper confidence interval limit.

Drug Drug interaction study - results¹

Geometric Mean Ratios ($AUC_{0-\infty}$, C_{max}): 3-Hour Separation

Veltassa® EU Summary of Product Characteristics:

Patiromer has the potential to bind some oral co-administered medicinal products, which could decrease their gastrointestinal absorption.

As precautionary measure, and based on the data summarised below, administration of patiromer should therefore be separated by at least 3 hours from other oral medicinal products.²

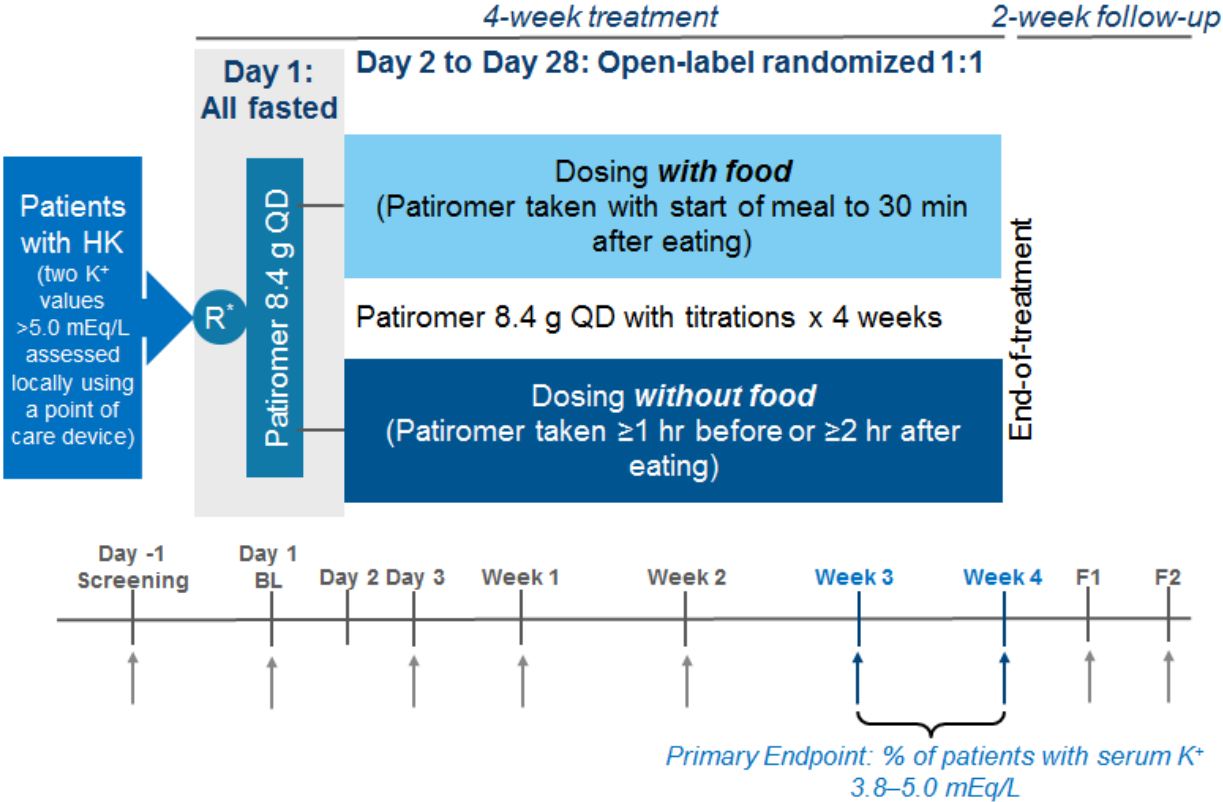

^aAs levothyroxine is recommended to be administered ½ hour to 1 hour before breakfast and patiromer is recommended to be administered with food, the two drugs were not administered at the same time and co-administration represents a 40 minute separation between levothyroxine and patiromer. Values adjusted for baseline thyroxine concentration; AUC for 48-hour sampling profile (AUC0-48) shown because extrapolation to infinity is not valid for levothyroxine. AUC for 48-hour sampling profile (AUC0-48) shown because extrapolation to infinity is not valid for levothyroxine.

Abbreviations: $AUC_{0-\infty}$, area under the plasma concentration time curve from time 0 extrapolated to infinity; AUC_{0-48} , area under the plasma concentration time curve from time 0 to 48-hour sampling; CI, confidence interval; C_{max} , maximum observed plasma concentration; LCL, lower confidence interval limit; N, number of subjects planned for enrollment for each drug evaluated; UCL, upper confidence interval limit.

AMBER Protocol Review

A Randomized, Double-Blind, Placebo-controlled, Parallel Group Study of Patiromer for the Enablement of Spironolactone Use for Blood Pressure Control in Patients with Resistant Hypertension and Chronic Kidney Disease: Evaluation of Safety and Efficacy (AMBER)

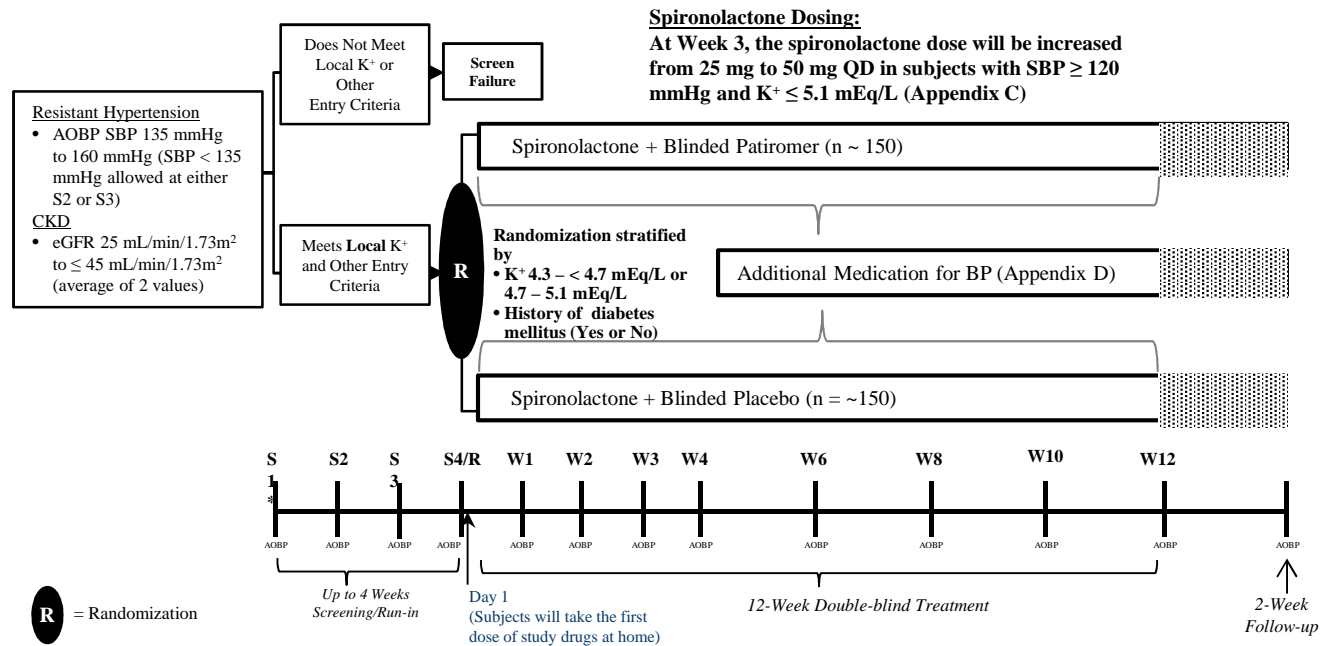

Rajiv Agarwal, Patrick Rossignol, Bill White, Brian Williams, D. Garza

07 Nov 2016

Study Objectives

To determine

- if patiromer treatment of subjects with CKD receiving spironolactone for the treatment of resistant hypertension will result in more persistent use of spironolactone through prevention of hyperkalemia and thereby,
- lead to improved blood pressure control compared with treatment with spironolactone alone (placebo)

*HBP also measured daily after S1 thru W12

Patients on RAASi were the primary patient population included into phase II – III program

Summary

- In clinical trials, the novel potassium binder patiromer demonstrated efficacy in the management of hyperkalaemia and is well tolerated compared with existing therapies
 - Patiromer has been studied in patients with HK, HF with or without CKD
- Patiromer offers a new option for the management of hyperkalaemia in cardio-renal patients who also require RAASi
- Patiromer has been available in the USA since December 2015 and has recently been approved in the EU in July 2017

4. INFORMATIONS CLINIQUES

4.1 Indications thérapeutiques

Veltassa est indiqué pour le traitement de l'hyperkaliémie chez l'adulte.

4.2 Posologie et mode d'administration

Posologie

La dose de départ recommandée est de 8,4 g de patiomer une fois par jour.

La dose de départ peut être ajustée à des intervalles d'une semaine ou plus, en fonction du taux de potassium sérique et de la plage cible souhaitée. La dose quotidienne peut être augmentée ou diminuée de 8,4 g, comme il convient pour atteindre la plage cible souhaitée, jusqu'à une dose maximale de 25,2 g par jour. Si le potassium sérique chute sous la plage souhaitée, la dose doit être réduite ou le traitement doit être arrêté.

En cas d'oubli d'une dose, celle-ci doit être prise dès que possible le même jour. La dose oubliée ne doit pas être prise avec la dose suivante.

L'administration de Veltassa doit être éloignée de 3 heures de la prise d'autres médicaments par voie orale (voir rubrique 4.5).

Le délai d'action de Veltassa est de 4 à 7 heures après l'administration. Veltassa ne doit pas remplacer le traitement d'urgence d'une hyperkaliémie mettant en jeu le pronostic vital.
